Documented Debugging Activity

Program debugged: password_strength_checker.py

IDE used: Visual Studio Code

Purpose: This document captures the debugging process for a Python program that checks password strength using functions. The screenshots shows a breakpoint, stepping into a function, and one additional debugging action.

Screenshot 1 - Breakpoint Created and Debugging Started

The program is paused before entering the `calculate_score` function. This confirms that the breakpoint is active and the debugger is running.

Screenshot 2 - Step Into the Function

Documented Debugging Activity

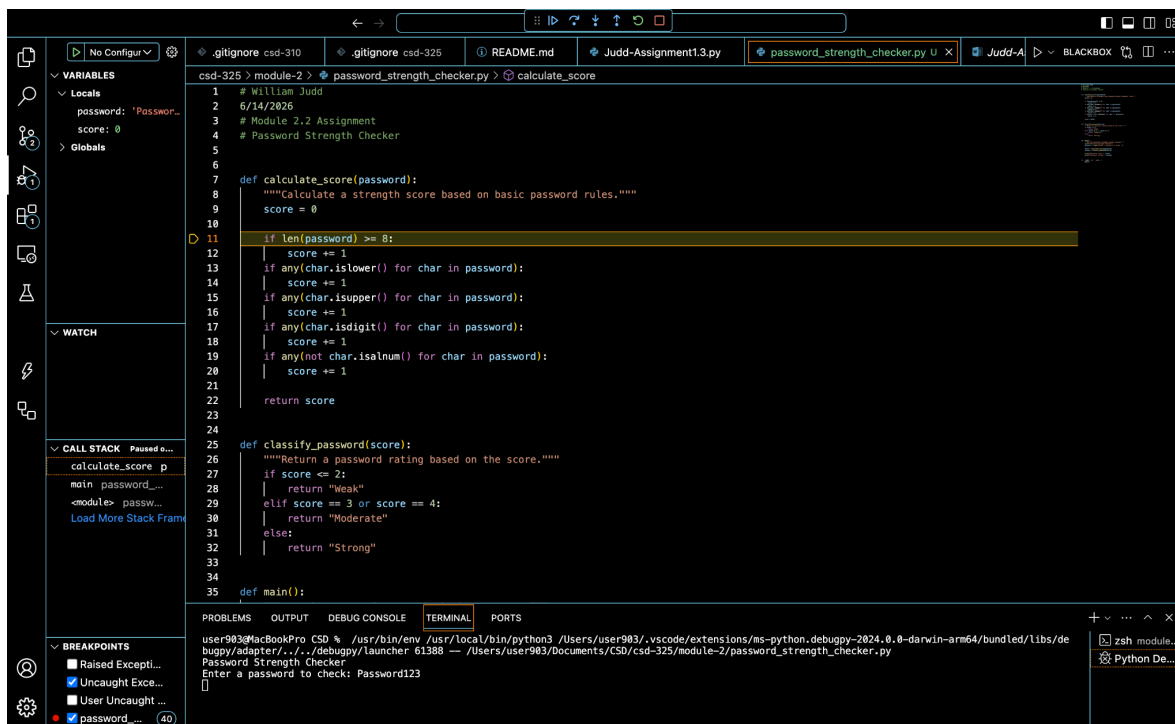

The debugger entered the `calculate_score()` function. At this point, I can inspect the password variable and observe how the score changes as each condition is evaluated.

Screenshot 3 - Continue Debugging or Inspect Variables

The debugger is being used to follow the program flow and inspect how the score and rating are produced.

Short Debugging Summary

While debugging this program, I set a breakpoint before the first function call inside `main()`. I then stepped into the `calculate_score()` function and observed how the password was evaluated against each rule. This helped me better understand how the score was calculated before being passed into the `classify_password()` function. The debugging process made it easier to follow the flow of the program rather than just reading the code from top to bottom.
